29-12-2025

- Overall she liked the work and the progress and also liked the way of null values handlling and said that null doesn't mean that it reached the destination (possibly ki meddo data nehoh on purpose for confidentiality) (she said u can tani tzido etablissment(create them to handle last null if you want (saw that as a stupid idea but didn't tell her)))

- The threshold that is used in the organization is 15 jours for international packages (to consider it as delayed)(she said you can adjust if needed for other ones)

- I asked about whether to work with the data separated or merged she said that merged but if u assure not losing tracability between receptacles and packages you can keep them separated if that suits u better

- concerning Abdellah questions about more details for the real time tracability and the reports she said when she we'll try to provide more info about the reports part and for the other info we can ask them any time for a specific info and she'll try to provide it (qalet since qoltoli you'll work only for the data mining part for now so ki tssahqo any additional specific detail qololi)

- For the service indicator qoltelha raho random malgré it should indicate the priority (according to S10)she said that you can invistigate more about it or even give another copy and explain in it how it should be according to the duration and the priority

conclusion : good progress and keep that, if u need details contact me

& share with me the github repo
